Abstract

Congenitally missing teeth (CMT), or as usually called hypodontia, is a highly prevalent and costly dental anomaly.[1,2] Besides an unfavorable appearance, patients with missing teeth may suffer from malocclusion, periodontal damage, insufficient alveolar bone growth, reduced chewing ability, inarticulate pronunciation and other problems. Treatment might be usually expensive and multidisciplinary.[3,4,5] This highly frequent and yet expensive anomaly is of interest to numerous clinical, basic science and public health fields such as orthodontics, pediatric dentistry, prosthodontics, periodontics, maxillofacial surgery, anatomy. This essay reviews the findings on the etiology, prevalence, risk factors, occurrence patterns, skeletal changes and treatments of congenitally missing teeth.[1-7] It seems that CMT usually appears in females and in the permanent dentition. It is not conclusive whether it tends to occur more in the maxilla or mandible and also in the anterior versus posterior segments.[8,8] It can accompany various complications and should be attended by expert teams as soon as possible. Congenitally missing teeth (CMT), or as usually called hypodontia, is a highly prevalent and costly dental anomaly. Besides an unfavorable appearance, patients with missing teeth may suffer from malocclusion, periodontal damage, insufficient alveolar bone growth, reduced chewing ability, inarticulate pronunciation and other problems.[1,10] Treatment might be usually expensive and multidisciplinary. This highly frequent and yet expensive anomaly is of interest to numerous clinical, basic science and public health fields such as orthodontics, pediatric dentistry, prosthodontics, periodontics, maxillofacial surgery, anatomy.[11,12] This essay reviews the findings on the etiology, prevalence, risk factors, occurrence patterns, skeletal changes and treatments of congenitally missing

teeth.[13] It seems that CMT usually appears in females and in the permanent dentition. It is not conclusive whether it tends to occur more in the maxilla or mandible and also in the anterior versus posterior segments.[14] It can accompany various complications and should be attended by expert teams as soon as possible.[1010] This common but costly issue is important to many dental specialties, including orthodontics, pediatric dentistry, prosthodontics, periodontics, maxillofacial surgery, anatomy, and even health insurance companies.[7,8] The available treatment modalities to replace congenitally missing teeth include prosthodontic fixed and removable prostheses, resin bonded retainers, orthodontic movement of maxillary canine to the lateral incisor site and single tooth implants.[8,10,11] Dental implants offer a promising treatment option for placement of congenitally missing teeth. Interdisciplinary approach may be needed in these cases. This presentation aims to present a cases reports of replacement of unilaterally congenitally missing maxillary lateral incisors with dental implants.[1-15]

Dr. ABU-HUSSIN M. has given courses and conferences in Spain, Portugal, France, Italy, Egypt, Germany, Croatia, Serbia, Azerbaijan, Hungary, Ireland, Russia, China, England, Austria, Israel, Romania, Mexico, Brasil, India, Turkey, Dubai (U.A.E.), and USA, and has received awards for his work in International Conferences. He has been involved in several research programs and has more than 375 publications in Greek and International Dental Journals and has co-authored a textbook for dental treatment of cancer patients. He has received several awards from the International Association of Pediatric Dentistry including the Beng Magnuson Award for best research paper and two Bright Smile Bright Future Awards. He has lectured as an invited speaker and participated in more than 280 oral presentations in Greek and International Meetings and has taught in many continuous education courses. He is dedicated to the clinical and research work in the field of pediatric dentistry and collaboration with other medical fields. His research interests are about the comprehensive cleft care and craniofacial anomalies, diagnosis and treatment of human congenital disorders, 3D analysis of human face, and human facial expression

and its clinical application with special regard to its application in orthodontics. He is focused and committed to extend her research in these areas improving the level of academic-clinical research, professional network, and teaching purposes. He is a member of various International Scientific Societies and Associations. For publication see; [Abu-Hussein Muhamad](#) or [ABU-HUSSEIN MUHAMAD - Μελετητής Google](#)
